# Overview of Pharmacy Module

Kit Check's optimized pharmacy module helps staff close more loops during reconciliation in both the pharmacy care area as well as the patient care area. The new module incorporates data sources from wholesaler files and narcotics vault files, giving more visibility to other controlled substance transactions. Examples of these are medication orders and medications loaded into the vault, medications dispensed, and admins in the EMR, among many other everyday occurrences.

How to Use Audit Table

The audit table within your pharmacy module is a powerful tool that identifies when there is a mismatch between wholesaler invoices and loads of controlled substances into your narcotics vault. Users can upload existing canned reports from wholesaler and narcotic vault systems and Bluesight will perform an immediate accounting to identify documentation variances. These variances can be reviewed immediately and further investigated to identify and remedy any issue.

Data Matching

✓ Ordered ✓ Loaded ✓ Missing

Module Initiation & Onboarding

Kit Check's industry-leading technology in this module offers a frictionless user experience that allows pharmacy staff to close more reconciliation loops while extracting accurate data. Because our goal is ease of use, the module is easy to integrate with your existing workflow and may only require user mapping and permissions, all of which can be granted by your IT team and with the help of a Kit Check customer service representative. We are at your service to achieve a simple onboarding process and answer questions along the way.

- Provides 100% closed-loop reconciliation between pharmacy care area and patient care area
- Facilitates wholesaler and narcotic vault reconciliation from existing hospital pharmacy data
- Discover event-matching data analytics via Audit Table
- Useful for Directory of Pharmacy, Pharmacist, Clinical Pharmacist, and Pharmacy Technician
